

FLORENT TARIOLLE

florent.tariolle@gmail.com · LinkedIn · Google Scholar · GitHub

Engineering student seeking a 6-month final-year research internship in deep learning, starting in 2027.

EDUCATION

INSA Rouen Normandy	Rouen, France
Engineering degree, Computer Science and AI, expected 2027	2023 - 2027
University of Rouen Normandy	Rouen, France
M.Sc. in Data Science, research-oriented MLAI track, expected 2027	2026 - 2027
Lycée Dupuy de Lôme	Lorient, France
CPGE MP (Preparatory Classes for Grandes Écoles, Mathematics and Physics)	2021 - 2023

PUBLICATIONS

Opportunistic Target Selection May 2026

F. Tariolle and F. Yger. *CAp 2026 (Conférence sur l'Apprentissage automatique)*.

- Introduced a lightweight wrapper for score-based black-box adversarial attacks using early class confidence signals to reduce class drift in undirected random-search attacks.
- Improved attacks by up to 27 percentage points in success rate and a 43% relative reduction in censored-mean iterations on ResNet-50, validated across 4,500 ImageNet attack runs on five standard classifiers.

EXPERIENCE

InterDigital Rennes, France
Deep Learning Research Intern May 2026 - Present

- Working on deep learning methods for next-generation video compression, focusing on VVC (H.266) in-loop filtering and decoder-side filter selection to improve reconstructed video quality and coding efficiency.

Enedis Rouen, France
Machine Learning Intern Jan 2026 - May 2026

- Working on deep generative models and large-scale pipelines to simulate high-frequency time series for 38 million customers, supporting a digital twin of the French electricity grid.

RESEARCH PROJECTS

DashVMC: Real-Time Discrete World-Model Control in Geometry Dash Feb 2026 - Present
Independent research project; manuscript in preparation.

- Built a real-time Geometry Dash Vision-Model-Controller system with FSQ tokenization, action-conditioned transformer dynamics, and an actor-critic trained from behavioural cloning plus PPO in imagined rollouts.
- Deployed the learned controller on live gameplay at 30 FPS and used the action-conditioned world model to sample plausible visual level continuations from real gameplay prefixes.
- Studied Structured Label Smoothing as an FSQ-neighbour prior; a matched IRIS/Pong diagnostic showed partial stability signals but no robust general improvement over cross-entropy.

AWARDS

Finalist, Hack the World(s) Hackathon Jun 2026
24-hour team project at a Yann LeCun-sponsored hackathon on JEPAs and world models

- Developed a geometry-aware joint-embedding EEG SSL system: strong SIGReg frozen-transfer baselines and Riemannian latent analysis showing structure in SPD covariance representations.

OPEN SOURCE

Rose (Active: 15K+ DAU) Sep 2025 - Present
Co-founder & Lead Developer

- Co-founded and led development of a high-traffic real-time customization tool used by 15K+ daily active users; coordinated a 6-person team and designed the Python backend, Cloudflare Workers WebSocket relay, and browser-side JavaScript integration.
- Replaced OCR-based state extraction with deterministic DOM parsing, reducing latency and operational complexity.

TECHNICAL SKILLS

Programming: Python, C++

AI & ML: PyTorch, CUDA; Deep Learning, Self-Supervised Learning, World Models, Model-Based RL and Planning

Languages: French (native), English (TOEIC 970/990)
